

AEON OS is an open-source AI orchestration platform: multi-tenant workspaces, a governed agent kernel, RAG knowledge bases, automations with human approvals, and evidence-backed governance - deployable self-hosted, on-prem, or air-gapped.

Platform capabilities

Multi-tenant workspaces

Workspaces, memberships, RBAC
Viewer / Operator / Admin roles
Tenant-isolated LLM providers

Agent kernel

Reflective agents + memory
Safe, validated tool runner
Swarms & automations

LLM routing & tuning

10+ providers, incl. local
Ollama / vLLM / LM Studio
Fine-tuning playbook

RAG & grounding

Hybrid retrieval
Grounding & citation gates
Per-sector policies

Governance & audit

Hash-chained audit ledger
PII / PHI redaction
Human-in-the-loop

Deployment

Self-hosted or on-prem
Air-gapped capable
No SaaS lock-in

Sector-adaptive intelligence

Seven policy-gated sector packs

Health, finance, government, defense, critical infrastructure, manufacturing, utilities - each with its own inference policy (grounding, citations, human review), a fine-tuning playbook, and automated per-sector accuracy gates.

Trust & readiness evidence

Verified engineering evidence - pilot-grade today

Measured quality gate in CI: 414 tests, Bandit 0 High, pip-audit clean; SBOM + DR-drill evidence artifacts per run.

Enforced grounding gates (retrieval ≥ 0.78 , groundedness ≥ 0.90 , citations 1.0) with hash-chained audit and assurance ledgers.

Threat model (prompt injection, tenant isolation, SSRF, exfiltration); IdP interop matrix (Entra ID, Okta, PIV/CAC); formal IR / access-review / retention policies.

Pilot-ready - never self-certified

AEON ships engineering readiness evidence and deployment controls, not self-issued certifications. FedRAMP, SOC 2, HIPAA, PCI, and CJIS require independent audits and agency agreements. AEON is built for the pilots and controlled assessments that lead there.
